

Section #11

1. The elongation of a steel cable is assumed to be linearly related to the amount of force applied. Five identical specimens of cable gave the following results when varying forces were applied.

| | | | | | |
|----------------|-----|-----|-----|-----|-----|
| Force (x) | 1.0 | 1.5 | 2.0 | 2.5 | 3.0 |
| Elongation (y) | 3.0 | 3.8 | 5.4 | 6.9 | 8.4 |

- (a) Use the method of least squares to fit the regression line.
- (b) Determine the coefficient of correlation for this linear relationship.
- (c) Estimate the expected elongation for a force of 1.8 using a 90% Prediction Interval.
2. Use least-squares regression to fit a linear polynomial to the data given in the table below:

| | | | | | | | | | |
|----------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| x | 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 |
| y | 418.41 | 418.61 | 418.69 | 418.99 | 419.19 | 419.32 | 419.52 | 419.79 | 419.99 |

- (a) Calculate the standard deviation for the regression line.
- (b) Use the fitted linear formula to estimate the y-value at $x = 73.7$.
- (c) Find the 95% Confidence Interval for the mean when x equals 68.
